Requirements Report

(Version 1.0)**1 April 2024**

1. Introduction

Social media dramatically impacts our thoughts and behaviors in the modern world, affecting every part of our lives. When combined with fashion, these platforms become potent forces that shape trends and self-expression. It increases visibility and community involvement while making fashion. A sophisticated grasp of this relationship's effects on influence, creativity, and social norms is necessary to navigate its complicated relationship. When we designed the Combined, we understood that these relationships would help us maximize social media's positive effects in Bilkent fashion. By starting with this motto, we created an android application that offers an atmosphere where Bilkenters can freely express themselves without hesitation and where they get into competition, which will result in improving their style.

2. Details

2.1 Features

“Combined” will use an Android database. Bilkent students will interact with each other via this app. By uniting fashion and social media, the app will have a unique function, allowing users to express their opinions while showing their fashion skills. The ranking system will choose who has the best combination among all students monthly. Besides, “Combined” will have many features that ease the experience of Bilkent students. We are here to create a friendly environment to help many unfashionable students. The app also has features:

1. Profile page: Combined, it will have a profile section that enables students to express themselves and show their fashion online. The profile section will also keep the profile up to

date by adding new photos to the group of images that have been shared before. Other users can reach any profile anytime by the personal "Friend List" feature.

2. Ranking the fashion: The best-looking Bilkenter will be displayed on the apex, which every other user can easily see. The list will be updated monthly. Congratulations, you are the best!

3. Interactions with posts: Combined will allow Bilkent students to rank each other's combines by one up to 5 or skip if they do not want to share their opinions. This will encourage students to improve their combined skills.

4. Sharing post: Users can share their combined content whenever they want; it is as close as one click. New shared photos will be added to the sharer profile section immediately.

5. Adding a friend: When a user wants to add someone as a friend, he will only need to reach the desired profile from the main page or others' friend list, that's all! When desired, users can get other profiles by selecting them from the "Friend List."

6. Commenting: Every user will feel free to share their best feelings and opinions by contributing a comment page, which will be unique to each post. If the user who shared the post wants to inform others, he can add a note, which will be pinned at the top of the comment section.

7. Advisors: Advisors will be chosen according to their success on the ranking page; the top 10 on the ranking list will have an opportunity. Advisors' comments will be displayed higher on others' comment pages. Advisors will have an "Advisor Badge" displayed in their profile.

2.2 Target Audience

When planning the Combined social media platform, we aimed to develop a warm environment among Bilkent students. Sharing personal photos globally might be inconvenient for some students. To achieve privacy, the beta version of Combined will only be available to students in Bilkent. In this way, students can express themselves without needing anything else than their combines.

2.3 Where did we get an idea?

Instagram^[1]: Instagram is a photo and video-sharing social networking service that allows users to upload media that can be edited with filters, organized by hashtags, and associated with a location via geographical tagging¹. This variety sometimes needs clarification, and users spend their precious time surfing between unrelated topics. On the other hand, Combined is built on specific issues to reduce confusion; users find what they are here for.

Combyne^[2]: In this application, users share their combines without showing themselves; they crop themselves from their outfits and post them as online stickers. However, this requires time and some skills from users and restricts its usability for everyone. Our app provides safety by making it accessible to specific groups of people. Also, sharing posts Combined takes little time and no skill.

Wear^[3]: The Wear app functions similarly to a shopping platform, allowing users to display combined advice or prices to indicate how much money is needed to purchase these. Nevertheless, in Combined, there is no such thing as financial discrimination, so pricing is not included in matching clothing colors or styles. The app will compare how well the clothes match and show which matches are rated better on a separate page, leaving other users'

displays on the main page unhindered. The Combined app gives everyone an equal opportunity to show themselves.

3. Summary & Conclusions

In conclusion, Combined is an Android social media app that will help the Bilkent community stay in touch. This app's primary features include enabling users to share their combine via their phones, which comes in handy when they need advice from other Bilkenters (ranked on a scale of 1 to 5). This app's profile, ranking, and home pages are additional advanced features that will help students connect with one another. For instance, as a computer engineering student in Bilkent, I find dressing appropriately challenging. Thus, students will feel better about themselves and gain confidence when they see how others rate them on a scale of 1 to 5, even if they are not in good shape.
